

CLAIMS

1. (canceled)

2. (previously presented) The method of claim 19, wherein the piezoelectric film is composed of aluminum nitride or zinc oxide.

3. (previously presented) The method of claim 19, wherein the patterned electrode is composed of aluminum or titanium.

4. (currently amended) The method of claim 19, ~~wherein~~ wherein the substrate is composed of silicon or gallium arsenide.

5. (canceled)

6. (currently amended) The method of claim 19, wherein ~~the second layer of material is formed by: depositing a non-conductive layer after patterning the first conductive layer; and planarizing the non-conducting layer is planarized by chemical mechanical polishing, polymer planarization, or polymer reflow with liftoff.~~

7-8. (canceled)

9. (previously presented) The method of claim 19, wherein the second layer is a non-conducting layer that has a low dielectric constant.

10. (previously presented) The method of claim 19, wherein the second layer is SiO₂.

11-18. (canceled)

19. (currently amended) A method of forming a thin film acoustic device, the method comprising the steps of:
forming a base electrode;
forming a second electrode;
forming a piezoelectric film between the base electrode and the second electrode to enable application of an electric field to the piezoelectric film, wherein the foregoing is accomplished by:

7 providing a substrate;
8 depositing and patterning a first conductive layer to define the base electrode with an
9 edge region having a first height relative to the substrate; and
10 placing a second layer of material over the substrate with a portion positioned along the
11 edge region of the base electrode, said portion having a height relative to the substrate so as to eliminate
12 or substantially reduce a step along the base electrode edge region relative to the first height, wherein the
13 second layer of material is formed by:
14 depositing a non-conductive layer after patterning the first conductive layer; and
15 planarizing the non-conducting layer by chemical mechanical polishing, polymer planarization,
16 or polymer reflow with liftoff.

1 20. (previously presented) The method of claim 19, wherein the step of forming the
2 piezoelectric film includes depositing the piezoelectric film on the patterned electrode and the second
3 layer.

1 21. (previously presented) The method of claim 19, wherein the piezoelectric film serves as
2 a support membrane for the device.

1 22. (currently amended) A method of forming a thin film acoustic device, comprising:
2 forming a base electrode on a substrate;
3 patterning the base electrode;
4 depositing a non-conducting layer on the patterned base electrode and substrate;
5 planarizing the non-conducting layer by chemical mechanical polishing, polymer planarization,
6 or polymer reflow with liftoff so that the non-conducting layer and patterned base electrode form a
7 continuous layer having a level surface;
8 forming a piezoelectric layer on the level surface of the continuous layer; and
9 forming a second electrode so that the piezoelectric layer is positioned between the base
10 electrode and the second electrode to enable application of an electric field to the piezoelectric film.

1 23. (previously presented) The method of claim 22, wherein the level surface provided by
2 the planarized non-conducting layer and patterned electrode improves the mechanical integrity of the
3 piezoelectric layer by eliminating the edge of the patterned electrode.

1 24. (canceled)

1 25. (currently amended) A piezoelectric device, comprising:
2 a substrate;
3 a base electrode formed over the substrate, including an edge region having a first height relative
4 to the substrate;
5 a second layer of material positioned over the substrate with a portion positioned along the edge
6 region of the base electrode, said portion having a height relative to the substrate so as to eliminate or
7 substantially reduce a step along the base electrode edge region relative to the first height;
8 a second electrode; and
9 a piezoelectric film positioned between the base electrode and the second electrode to enable
10 application of an electric field to the piezoelectric film, wherein the second layer of material is formed
11 by:
12 depositing a non-conductive layer on the base electrode and the substrate; and
13 planarizing the non-conducting layer by chemical mechanical polishing, polymer planarization,
14 or polymer reflow with liftoff.

1 26. (new) The method of claim 19, wherein the non-conducting layer is planarized by
2 polymer reflow with liftoff.

1 27. (new) The method of claim 19, wherein the base electrode is formed by:
2 applying the first layer of electrode material on the substrate;
3 applying and patterning non-electrode material over the first layer of electrode material to form
4 an etch mask;
5 etching the electrode material to form the base electrode under the non-electrode material;
6 applying the second layer of non-conducting material over the non-electrode material and
7 adjacent to the base electrode; and
8 removing the non-conducting material over the non-electrode material and the non-electrode
9 material, leaving the non-conducting material adjacent to the base electrode.

1 28. (new) The method of claim 22, wherein the non-conducting layer is planarized by
2 chemical mechanical polishing.

1 29. (new) The method of claim 22, wherein the non-conducting layer is planarized by
2 polymer reflow with liftoff.

1 30. (new) The method of claim 22, wherein the continuous layer is formed by:
2 applying a layer of electrode material on the substrate;
3 applying and patterning a layer of non-electrode material over the layer of electrode material to
4 form an etch mask;
5 etching the electrode material to form the base electrode under the non-electrode material;
6 applying non-conducting material over the non-electrode material and adjacent to the base
7 electrode; and
8 removing the non-conducting material over the non-electrode material and the non-electrode
9 material, leaving the non-conducting material adjacent to the base electrode.

1 31. (new) The method of claim 30, wherein:
2 the non-electrode material is a polymer material; and
3 the non-conducting material over the polymer material and the polymer material are removed by
4 immersion in a liquid polymer solvent to lift off the non-conducting material over the polymer material.

1 32. (new) The method of claim 30, wherein:
2 the electrode material is etched using an isotropic process to create the base electrode having an
3 undercut profile under the non-electrode material; and
4 the non-electrode material over the base electrode is reflowed after creating the base electrode
5 having the undercut profile to retract the non-electrode material towards the edge of the electrode.

1 33. (new) The method of claim 32, wherein:
2 the non-electrode material is a polymer material; and
3 the non-conducting material over the polymer material and the polymer material are removed by
4 immersion in a liquid polymer solvent to lift off the non-conducting material over the polymer material.
